## Bound on Derivatives of a Holomorphic Function

- ▶ Let  $f : O \rightarrow \mathbb{C}$  be holomorphic and  $D(z_0, r) \subset O$
- ▶ Let  $\|f\|_r = \sup\{|f(z)| : z \in \partial D(z_0, r)\}$
- ▶ If  $c(t) = z_0 + re^{it}$ , then

$$\begin{aligned} \left| \frac{f^{(k)}(z_0)}{k!} \right| &= \left| \frac{1}{2\pi i} \int_c \frac{f(z)}{(z - z_0)^{k+1}} dz \right| \\ &= \frac{1}{2\pi} \left| \int_{t=0}^{t=2\pi} \frac{f(c(t))}{r^{k+1} e^{i(k+1)t}} ire^{it} dt \right| \\ &\leq \frac{1}{2\pi} \int_{t=0}^{t=2\pi} \frac{|f(c(t))|}{r^k} dt \\ &\leq \frac{\|f\|_r}{r^k} \end{aligned}$$

# Liouville's Theorem: A Bounded Entire Function is Constant

- ▶ An entire function is a function that is holomorphic on all of  $\mathbb{C}$
- ▶ Examples
  - ▶ Any polynomial  $p(z) = a_0 + a_1z + \cdots + a_nz^n$
  - ▶  $e^{p(z)}$  for any polynomial  $p$
  - ▶  $\sin(z)$ ,  $\cos(z)$
- ▶ A function  $f$  is bounded if there exists  $C > 0$  such that  $|f(z)| \leq C$  for all  $z$  in the domain of  $f$
- ▶ **Liouville's Theorem.** Any bounded entire function is a constant function
- ▶ **Proof.** For each  $z_0 \in \mathbb{C}$ ,
  - ▶ If  $f$  is bounded by  $C$ , then for any  $r > 0$ ,  $\|f\|_r \leq C$
  - ▶ Therefore, for any  $r > 0$ ,

$$|f'(z_0)| \leq \frac{\|f\|_r}{r^k} \leq \frac{C}{r^k},$$

which implies  $f'(z_0) = 0$

- ▶ Since this holds for every  $z_0 \in \mathbb{C}$ ,  $f$  is constant

# Fundamental Theorem of Algebra

- ▶ **Corollary.** Any nonconstant polynomial has at least one complex root
- ▶ **Fact.** A nonconstant polynomial is unbounded
  - ▶ If  $|z| > 1$ , then for any  $k \geq 1$ ,  $|z|^k > |z|$  and therefore

$$\begin{aligned}|f(z)| &= \left| a_n z^n \left( \frac{b_0}{z^n} + \cdots + \frac{b_{n-1}}{z} + 1 \right) \right| \\ &\leq |a_n| |z|^n \left( 1 - \frac{|b_0| + \cdots + |b_{n-1}|}{|z|} \right)\end{aligned}$$

- ▶ Therefore, if

$$|z| > R > 2(|b_0| + \cdots + |b_{n-1}|),$$

then

$$|f(z)| > \frac{|a_n|}{2} R^n$$

# Proof of Fundamental Theorem of Algebra

- ▶ **Proof.** Let  $f(z) = a_0 + a_1z + \cdots + a_nz^n$  and

$$g(z) = \frac{1}{f(z)}$$

- ▶ If  $n > 0$ , then there exists  $R > 0$  such that

$$|z| > R \implies |f(z)| > 1$$

- ▶ If  $f$  has no roots, there exists  $c > 0$  such that if  $|z| \leq R$ , then

$$|f(z)| > c$$

- ▶ Therefore,

$$|g(z)| \leq \max\left(1, \frac{1}{c}\right)$$

- ▶ It follows that  $g$  is a bounded entire function and therefore constant
- ▶ This implies that  $f$  is constant

## Orientation of a Curve

- ▶ A curve  $c$  is always a continuous parameterized curve

$$c : [a, b] \rightarrow \mathbb{C}$$

- ▶ Two nonconstant parameterized curves

$$c_1 : [a_1, b_1] \rightarrow \mathbb{C} \text{ and } c_2 : [a_2, b_2] \rightarrow \mathbb{C}$$

parameterize the same curve if there exists a monotone function

$$u : [a_1, b_1] \rightarrow [a_2, b_2]$$

such that  $u(a_1) = a_2$ ,  $u(b_1) = b_2$ , and, for each  $t \in [a_1, b_1]$ ,

$$c_1(t) = c_2(u(t))$$

- ▶ If  $f$  is increasing then the two curves have the same orientation
- ▶ If  $f$  is decreasing then the two curves have opposite orientations

## Reverse Orientation of Curve

- ▶ Given a curve  $c : [a, b] \rightarrow \mathbb{C}$ , the curve

$$\begin{aligned}(-c) : [b, a] &\rightarrow \mathbb{C} \\ t &\mapsto c(t)\end{aligned}$$

parameterizes the same curve but with the opposite orientation

- ▶ If  $f$  is holomorphic on an open set containing  $c$ , then

$$\begin{aligned}\int_{-c} f(z) dz &= \int_{t=b}^{t=a} f(c(t))c'(t) dt \\ &= - \int_{t=a}^{t=b} f(c(t))c'(t) dt \\ &= - \int_c f(z) dz\end{aligned}$$

## Contour Integral of Oriented Curves

- ▶ If  $c_1 : [a_1, b_1] \rightarrow \mathbb{C}$  and  $c_2 : [a_2, b_2] \rightarrow \mathbb{C}$  parameterize the same curve and have the same orientation, then for any holomorphic  $f$ ,

$$\begin{aligned}\int_{c_2} f(z) dz &= \int_{u=a_2}^{u=b_2} f(c_2(u))c_2'(u) du \\ &= \int_{t=a_1}^{t=b_1} f(c_2(u(t)))c_2'(u(t))u'(t) dt \\ &= \int_{t=a_1}^{t=b_1} f(c_1(t))c_1'(t) dt \\ &= \int_{c_1} f(z) dz\end{aligned}$$

- ▶ A similar calculation shows that if  $c_1$  and  $c_2$  have opposite orientations, then

$$\int_{c_2} f(z) dz = - \int_{c_1} f(z) dz$$
